

Python (Programmiersprache)

Python is a general-purpose , usually interpreted , high-level programming language . [14] It aims to promote a readable, concise programming style. [15] For example, blocks are structured by indentation rather than curly brackets. Python supports several programming paradigms , such as object-oriented , aspect-oriented, and functional programming. It also features dynamic typing . Like many dynamic languages, Python is often used as a scripting language . The language has an open, community-based development model supported by the nonprofit Python

Guido van Rossum
